TIOGA

Maintaining an Edge

Throughout its history, Tioga's aim has been to improve the quality of the cycling experience -- this quest often leads to innovations. Through its consistent role as a successful innovator, Tioga and its cyclists have remained at the top of the field for several decades. Tioga's trailblazing efforts have benefited the industry as a whole and set new standards in bike and component manufacturing.

Creating new standards is never the mission at Tioga; it is simply the means to reach the goal of improving the riding experience. In embracing this philosophy, Tioga has often dismissed convention to stay true to its belief. For example, at the outset of the mountain biking trend, Tioga forecasted the need for a sturdier front end on the mountain bike, where the main steering components are located, and one that could withstand the added stress that downhill and rough terrain riding placed on the bike. Making this change was substantial as it required Tioga to reengineer the entire front end of the bike from the fork steer tube, to the head set (bearings within the head tube of the frame to allow steering), up to the stem. The company dismissed a standard that had been used for decades to recreate a larger diameter front end that strikes a perfect balance of added strength with minimal weight penalty. Tioga figured that the new sizing is absolutely required for the safety of all cyclists as well as for the advancement of mountain bike technologies that it rallied the industry's top manufacturers around the change. In creating the new standard, Tioga completely changed the way bicycles are designed and allowed designers to create stronger, faster bikes. The significance of this change is tantamount to widening of the rail road tracks for better stability, thus requiring all train manufacturers to redesign their trains to be compatible with the wider tracks. For a number of years, the reengineered size was fondly referred to as "Tioga size." To this day, the 1-1/8" "Tioga size" steer tube remains the industry standard.

Another example of how Tioga's passion for improving the quality of the ride created another innovation that advanced the cycling world was the company's development and promotion of a true BMX tire – the Competition III. Prior to the Comp-III, BMX tires were all essentially scaled-down versions of motorcycle motocross tires, as BMX was a derivative motocross. However, Tioga's engineers realized that BMX required specialized treads that would harness the much smaller amount of power coming from the rear wheel (compared to motocross) and take full advantage of the maneuverability of BMX bikes. The result was a unique tread pattern invented for the Comp III Tire that maximized traction as well as allowed better acceleration. Within two years of its introduction, the Comp-III became the most widely used BMX tire on the market, and is today, more than 30 years since its introduction, still one of the most recognizable tread patterns around.

Tioga's commitment to enhancing the riding experience also is evident in the development of another industry changing Tioga DH saddle, an extended saddle (3" longer than the prevailing model) with thicker padding that allowed riders to better maneuver descents. Spurred on by the downhill biking trend in the late 1990's, this improvement challenged the conventional uses of the saddle and gave it a purpose beyond merely a sitting device. Understanding that experienced cyclists navigating more technical terrains often grip the saddle with his or her thighs to better control the bike's movement, especially on high-speed descents, the elongated model provided more surface area for the rider's thighs to grip, translating into better control during out-of-saddle maneuvering. The Tioga Downhill saddle defined the Downhill saddle segment and created numerous imitators.

Tioga's unconventional approach to addressing cyclists' needs continued with the advent of the Tioga Spyder saddle in 2006 - a first-of-its kind lightweight racing saddle offering unmatched shock absorption and comfort without the need for padding. Tioga's engineers observed that the thin padding typically found on enthusiasts' level racing saddles serves the purpose of conforming to the sit-bone for initial comfort, but does little for actual shock absorption. So instead of relying on padding to absorb shock, Tioga decided to eliminate the pad altogether, and instead, develop a flexible shell that supports the rider's weight evenly while providing more shock-absorbing flex than conventional padding. The result is a super-lightweight racing saddle with unmatched levels of shock absorption and comfort in a stunning appearance that was a winner of the 2009 Red Dot Design Award.

In keeping with this tradition and successful formula, Tioga debuts several new products this season that are poised to become instant classics.

The Psycho Genius and Psycho Genius Venture MTB tires – the first mountain bike tire with a tread designed to actively adapt to rider input and the changing terrain environment. The new tires incorporate Tioga's Dynamic Knob Technology which utilizes unique knob architecture matched with specially formulated rubber compounds enabling individual knobs to actually change and alter its shape, enhancing tread surface contact, increasing traction as needed.

ZEROaxle pedal systems – revolutionary platform pedal system with a true breakthrough pedal body form factor that's 100% compatible with existing crank standards. ZEROaxle pedals utilizes oversize bearing redirected inboard, which eliminates the traditional pedal spindle, permitting advantageous pedal body designs not possible with conventional construction. The first pedal available with the ZEROaxle system is the MT-ZERO mountain bike pedal – with a body profile measuring a mere 7mm (and 4.5mm at the thinnest), it's the thinnest dual-concave pedal in the world. More stunningly unique ZEROaxle pedals will be available in the next few months to further establish Tioga as a true innovator of cycling components.

ZERO AXLE

The ZEROaxle pedal system is modular and designed to be virtually maintenance free.

Should the bearing wear down, simply replace the ZEROaxle bolt. The same applies to the body. Replacement ZEROaxle bolt and MT-ZERO body are available individually, in left or right configurations. Its modular design will also allow users to easily switch different body designs from any current and future ZEROaxle pedals.

D-SPYDER PEDAL

- 6061-T6 Alloy CNC

SPYDER STRATUM

Turning traditional saddle designs upside down in pursuit of cutting-edge performance and function, the Spyder Stratum's ingeniously engineered flexible shell achieves unmatched levels of comfort and performance by suspending the rider in a way not possible with traditional saddle designs. Manufactured with proprietary dual density material seamlessly fused together to form the most durable and energy-absorbent Spyder saddles ever.

RADIAL WEDGE SYSTEM

Turning the allen bolts activate the angular wedge of the internal clamping system and effectively secures the Nighthawk stem onto steer tube.

Bioergonomic Grips

- Anatomically shaped to match the natural contours of the gripping hand.
- Patented multi-radii design (U.S. Patent Number 4,964,192) allows greater control and improved handling even for riders with small hands.
- Variable thickness places padding where it is needed most for maximum shock absorption.
- Non-slip flared ends.
- Constructed of ultraviolet resistant VEXK rubber compound.
